Cracking the Clipboard

Presenter
- Daniel from New York Hotel & Motel Trades Council
  - dshockley@nyhtc.org

starter code is on github
- https://github.com/DanShockley/FmClipTools
- everything is applescripts
- they use Keyboard Maestro to trigger scripts, but could easily use Alfred Workflows or your applescript launcher of choice

what's in the clipboard
- XML, looks a lot like the DDR
- can't be pasted directly in to a text editor, because the datatype is not text
- clipboards can contain more than one object type, but (by default) only one of each object type

Can do it within your file, or within a runtime
- BaseElements plugin
  - has ability to get and set clipboard object types
- advantage of runtime is that it creates a separate application, so you can keep it open in parallel to your work in FileMaker

Not clipboard-related
- "Developer" privilege set instead of "[Full Access]"
  - use scripts that have "Run as Full Access" to do things like open Manage Database
  - could apply to Implementors
